In response to the notification of April 20, 2005:

The applicant requests examination of his European patent application and designates all contracting states. The corresponding fees are paid by collective remittance.

Furthermore the applicant submits a PACE request with the enclosed separate form.

In order to facilitate examination the applicant would kindly like to comment on the extended European search report of June 24, 2004, as follows:

- a) As it has already been pointed out in the applicant's letter to the EPO dated July 21, 2004, the lack of unity objections raised by the Search Division are not justified. It is therefore kindly requested to refund the additional search fees which have been paid.

- b) As to the "X" classification of document US 4690370 A (D1) and the corresponding novelty objection raised by the EPO in section 2.1 of the extended European Search Report, the applicant kindly wishes to contradict this analysis as follows:

The characterising part of independent claim 1 reads:

*"characterised in that said method comprises the step of coating at least a part of said master with a **smoothing** layer"*

As defined on page 3, line 4 of the originally filed description,

"this smoothing layer is a layer which due to a certain flowability of its material displays a smaller roughness at its top surface than the surface on which it has been grown, in contrast to for example ordinary metallic monolayers ..."

Taking this definition of a smoothing layer into consideration it will be seen that document D1 does not disclose a **smoothing** layer, but instead only discloses a smooth layer which is grown on top of a smooth surface. Document D1 does therefore not disclose the features of the characterising part of claim 1. In detail:

Document D1 teaches to provide a surface coating 34 on a surface portion 32 of a mold 24. This surface coating may be provided by sputtering (see for example column 2, line 16).

Document D1 repeatedly emphasises that the roughness on top of the surface coating 34 is exactly identical to the roughness of the surface portion 32 on which it has been grown, see for example column 1, line 57 to 65, column 2, first paragraph, column 2, lines 13 – 19, column 4, lines 20 – 31 as well as claims 1 and 4 of D1. All of these passages repeatedly point out that the surface

AP20 Rec'd PCT/PTO 27 APR 2006

roughness values of the surface portion 32 and its surface coating 34 on top are absolutely identical, amounting to $12,5 \times 10^{-8}$ meters RMS.

In particular the passage in column 4, lines 26 – 31 makes clear that this surface roughness value of the "substrate" is obtained

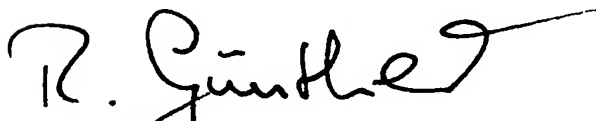

"by smoothing the surface portion 32 of the mold 24 until it has a roughness of no more than about $12,5 \times 10^{-8}$ meters RMS".

When this roughness value is obtained, the surface coating 34 is grown on the surface portion by sputtering. The final surface roughness, however, is not at all changed by the provision of the surface coating.

In other words, the surface coating 34 proposed in D1 is smooth (at least in the sense of D1) because it is grown on a smooth substrate, but it does not at all actively help to improve the surface roughness value of the mold.

This provision of this **smooth** layer on a smooth substrate has nothing to do with the idea to provide a **smoothing** layer which actively contributes to improving the surface roughness of a replication master according to the invention.

Only as a side remark the applicant would kindly like to point out that prior art document D2 which has also briefly been discussed in the extended European search report does not give the slightest hint as to such a smoothing layer, either.
